Trip Advisor Hotel Reviews - Case Study

Explore Hotel aspects and Predict the rating of each review.

Hotels play a crucial role in traveling and with the increased access to information new pathways of selecting the best ones emerged. With this dataset, consisting of 20k reviews crawled from Tripadvisor, you can explore what makes a great hotel and maybe even use this model in your travels!

This Case Study is taken from : https://www.kaggle.com/andrewmvd/trip-advisor-hotel-reviews

Summary of my Idea and what I did.

The problem given is to predict whether the "review" given is either good or bad by using "rating" as class label. How good the model predicts is to be found based on the metrics given i.e MAE and RMSE.
We can generally understand that if the rating is 3 and above, it is good or else it is bad.
In this task, we have to predict the rating based on the review which should be automaticlly done by our model and that rating which inturn decides the review is either good or bad. As, we have 1-5 rating range for every review, we have to predict the rating in that range only by classification.
This means, the problem is a "Muti-Class Classification" problem.
We can use classification ML techniques like SVM, Decision Trees, Random Forest, Boosting techniques etc., and Deep Learning models too using certain type of loss and activation function.
Finally based on the metrics we have to decide which model to use. The metric we use is F1-Score and it's given to use RMSE and MAE.
I've covered 3 models which are Linear SVM, LGBMClassifer and a Deep Learning Model and analysed results.

Reading the file

In [111]:

```
df = pd.read_csv("tripadvisor_hotel_reviews.csv")
df.head()
```

Out[111]:

	Review	Rating
0	nice hotel expensive parking got good deal sta...	4
1	ok nothing special charge diamond member hilto...	2
2	nice rooms not 4* experience hotel monaco seat...	3
3	unique, great stay, wonderful time hotel monac...	5
4	great stay great stay, went seahawk game aweso...	5

Exploratory Data Analysis

Shape of the file

In [4]:

```
df.shape
```

Out[4]:

```
(20491, 2)
```

There are 20491 rows and 2 columns.

```
train,cv,test = compute_text(X_train,X_cv,X_test,tokenizer)
```

Using Glove Vectors as Pre-trianed word vectors embedding

In [34]:

```
with open('glove_vectors', 'rb') as f:
 glove=pickle.load(f)
 glove_words=set(glove.keys())
```

```
embedd_matrix= np.zeros((len(tokenizer.word_index)+1,300))
for i,j in tokenizer.word_index.items():
  if i in glove_words:
   embed_vec=glove[i]
   embedd_matrix[j]=embed_vec
print(embed_vec.shape,embedd_matrix.shape)
```

```
(300,) (48904, 300)
```

In [35]:

```
cv.shape
```

BATCH_SIZE = 100
```

Training the model

In [ ]:

```
history = model.fit(train, y_train, epochs=EPOCHS, validation_split=0.25, batch_size=BATCH_SIZE,
                    verbose=2)
```

The training is taking more time than expected. So, I'm skipping for now.

```

```

Conclusion

In [119]:

```
from prettytable import PrettyTable

x=PrettyTable()

x.field_names=(['Model','Test F1-Score','MAE','RMSE'])
x.add_row(['Linear SVM','0.525','1.142','0.691'])
x.add_row(['LGBMClassifier','0.593','0.830','0.48'])
x.add_row(['LSTM Model','-','-','-'])
print(x)
```

```
+----------------+---------------+-------+-------+
|     Model      | Test F1-Score |  MAE  |  RMSE |
+----------------+---------------+-------+-------+
|   Linear SVM   |     0.525     | 1.142 | 0.691 |
| LGBMClassifier |     0.593     | 0.830 |  0.48 |
|   LSTM Model   |       -       |   -   |   -   |
+----------------+---------------+-------+-------+
```

By the above results we can LGBMClassifier performs better compared to Linear SVM.
